

puramyst

Specialist in interior sterilisation since 2013

Protect your business against infectious bacteria and touch viruses

You cannot afford to risk the well-being of clients and employees. Without doubt the most efficient and effective way to help prevent or treat a modern virus is to use targeted touchpoint disinfection and to spray your premises and equipment with the PuraMyst sterilising cloud.

The unique particle technology used ensures that even the areas and surfaces hidden from sight or difficult to access are also treated. PuraMyst disinfection solutions offer businesses a high level of protection.

- Effective surface and air decontamination and sterilisation
- Micro-particle technology is dry on contact
- Effective against spores, moulds and bacteria
- Effective against MRSA, Norovirus, Flu and respiratory viruses
- High Kill rate (99.999%)
- Ultimate defence on-board against bacteria and viruses

The process

Using specialised equipment our technicians move through your chosen spaces and spray a fine mist throughout the entire area (or selected areas) using a specialised biocide which is perfectly acceptable for humans but deadly for airborne and surface pathogens.

It contains a safe biocide which eradicates 99.999% of all airborne and surface pathogens and viruses including MRSA, Legionnaires, Salmonella and Norovirus, as well as modern viruses that can cause including those causing flu-like and respiratory inflammation.

Safe to use on furnishings

There's no need to cover any surfaces or soft furnishings. PuraMyst is safe to use on any surface including fabrics.

PuraMyst completely sterilises walls, floors and surfaces to remove hidden threats and leaves no visible trace or residues.

PuraMyst. The visual fog that sterilises the air and everything it touches...

Be careful against false claims.

No disinfectant, at this time, may make a claim that it is effective at killing the COVID-19 Coronavirus. This is because COVID-19 is novel and actual testing has not occurred.

However, the structure of these viruses includes a lipid envelope, which is easily compromised by most disinfectants. Once the lipid envelope is damaged, the integrity of the virus is compromised, thereby neutralising its infectivity.
